

Global Wealth Databook 2023

Leading perspectives
to navigate the future

Preface

The 2023 edition of the Global Wealth Report reflects on a year that has delivered a significant setback in what had been a consistent uptrend in the accumulation of wealth in the household sector. 2022 recorded the first fall in net global household wealth since the global financial crisis of 2008.

Measured in current nominal USD, total net private wealth fell by USD 11.3 trillion (-2.4%) to USD 454.4 trillion at the end of the year. Wealth per adult also declined by USD 3,198 (-3.6%) to reach USD 84,718 per adult at end-2022. Much of this decline comes from the appreciation of the US dollar against many other currencies. If exchange rates are held constant at 2021 rates, then total wealth increased by 3.4% and wealth per adult by 2.2% during 2022. This is still the slowest increase of wealth at constant exchange rates since 2008. Keeping exchange rates constant but counting the effects of inflation results in a real wealth loss of -2.6% in 2022.

A more detailed examination shows that financial assets contributed most to wealth declines in 2022 while non-financial assets (mostly real estate) stayed resilient, despite rapidly rising interest rates. But the relative contributions of financial and non-financial assets may reverse in 2023 if house prices decline in response to higher interest rates.

Regionally, the loss of global wealth was heavily concentrated in wealthier regions such as North America and Europe, which together shed USD 10.9 trillion. Asia Pacific recorded losses of USD 2.1 trillion, while Latin America is the outlier with a total wealth increase of USD 2.4 trillion, helped by an average 6% currency appreciation against the US dollar. Heading the list of losses in country terms in 2022 is the United States, followed by Japan, China, Canada and Australia. The largest wealth increases at the other end were recorded for Russia, Mexico, India and Brazil.

In terms of wealth per adult, Switzerland continues to top the list followed by the USA, Hong Kong SAR, Australia and Denmark despite sizeable reductions in mean wealth versus 2021. Ranking markets by median wealth results in a different list, with Belgium in the lead followed by Australia, Hong Kong SAR, New Zealand and Denmark.

When looked at in demographic terms, Generation X and Millennials continued to do relatively well in 2022 in the USA and Canada but were not immune to the overall wealth reduction. Broken down by race, non-Hispanic Caucasians in the USA saw their wealth decrease in 2022, while African-Americans were left almost unscathed by the downturn. In contrast, Hispanics achieved 9.5% growth in 2022, owing to their greater holdings of housing assets compared to financial assets.

Along with the decline in aggregate wealth, overall wealth inequality also fell in 2022, with the wealth share of the global top 1% falling to 44.5%. The number of USD millionaires worldwide fell by 3.5 million during 2022 to 59.4 million people before taking into account 4.4 million “inflation millionaires” who would no longer qualify if the millionaire threshold were adjusted for inflation in 2022. Global median wealth, arguably a more meaningful indicator of how the typical person is faring, did in fact rise by 3% in 2022 in contrast to the 3.6% fall in wealth per adult. For the world as a whole, median wealth has increased five-fold this century at roughly double the pace of wealth per adult, largely due to the rapid wealth growth in China.

According to our projections, global wealth will rise by 38% over the next five years, reaching USD 629 trillion by 2027. Growth by middle-income markets will be the primary driver of global trends. We estimate wealth per adult to reach USD 110,270 in 2027 and the number of millionaires to reach 86 million while the number of ultra-high-net-worth individuals (UHNWIs) is likely to rise to 372,000 individuals.

1. Estimating the pattern of global household wealth

1.1 Introduction

We provide estimates of the wealth holdings of households around the world for each year since 2000. More specifically, we are interested in the distribution within and across markets of individual net worth, defined as the marketable value of financial assets plus non-financial assets (principally housing and land) less debts. No market in the world has a single comprehensive source of information on personal wealth, and many low- and middle-income markets have little direct evidence of any kind. However, a growing number of markets – including China and India, as well as many high-income markets – have relevant data from a variety of different sources, which we are able to exploit in order to achieve our objective.

We focus on 217 markets or economically self-governing territories (such as Hong Kong SAR) for which population sizes are recorded by the United Nations and which also have GDP and exchange rate data. These “markets” are listed in Table 2-1 along with some summary details. Note that China and India are treated as separate regions due to the size of their populations.

Our estimation procedure involves three main steps, the first two of which follow the structure set out in Davies et al. (2008, 2011). (See also Davies et al., 2017.) The first step establishes the average level of wealth for each market. The best source of data for this purpose is household balance sheet (HBS) data, which are now provided by 51 markets, although 24 of these markets cover only financial assets and debts. For an additional two markets, wealth levels can be calculated from household survey data. Together these markets cover 64% of the global population and 93% of total global wealth.

For markets without HBS or survey data we use standard econometric techniques to estimate net wealth levels and its components for a further 118 markets. This leaves 46 markets lacking sufficient suitable data for wealth estimation. Most of these are small island states in the Pacific or Caribbean. The remainder are either small (e.g., Andorra, Monaco) or semi-detached from the global economy (e.g., Cuba, Somalia, North Korea). Together these markets account for only 4.9% of global adults and 0.9% of global wealth. But for completeness, we assign net wealth values to these markets based on the assumption that their wealth/GDP ratio is the same as the subregion to which they belong (which is generally a good rule of thumb). However, because these estimates are less reliable, we do not report the detailed results for these markets in the summary Table 2-2 or elsewhere.

The second step in our estimation procedure involves constructing the pattern of wealth holdings within markets. We use direct data on the distribution of wealth for 40 markets. Inspection of data for these markets suggests a relationship between wealth distribution and income distribution, within world regions, that can be exploited in order to provide an initial estimate of wealth distribution for another 140 markets, which have data on income distribution but not on wealth ownership. The remaining 37 markets are a subset of the 46 markets to which we assigned wealth levels above. We follow a similar procedure here and assign to each of these markets the average wealth pattern of its (United Markets) subregion.

It is well known that the traditional sources of wealth distribution data are unlikely to provide an accurate picture of wealth ownership in the top tail of the distribution for most markets. To overcome this deficiency, the third step makes use of the information in the Forbes world list of billionaires to adjust the wealth distribution pattern in the highest wealth ranges.

The following sections describe the estimation procedures in more detail. Two other general points should be mentioned at the outset. First, we use official exchange rates throughout to convert currencies to our standard measure of value, which is US dollars at the time in question (usually end-year). In international comparisons of consumption or income, it is common to convert currencies using purchasing power parity (PPP) exchange rates, which take account of local prices, especially for non-traded services. However, in all markets, a large share of personal wealth is owned by households in the top few percentiles of the distribution who tend to be internationally mobile and to move their assets across borders with significant frequency. For such people, the prevailing foreign currency rate is most relevant for international comparisons. So there is a stronger case for using official exchange rates in studies of global wealth.

The second issue concerns the appropriate unit of analysis. A case can be made for basing the analysis on households or families. However, personal assets and debts are typically owned (or owed) by named individuals and may be retained by those individuals if they leave the family. Furthermore, even though some household assets, such as housing, provide communal benefits in households that include members other than a single individual or married couple, it is unusual for members to have an equal say in the management of assets, or to share equally in the proceeds if the asset is sold. Membership of households can be

quite fluid (e.g., with respect to older children living away from home) and the pattern of household structure varies markedly across markets. For all these reasons – plus the practical consideration that the number of households is unknown in most markets – we prefer to base our analysis on individuals rather than household or family units. More specifically, since children have little formal or actual wealth ownership, we focus on wealth ownership by adults, defined to be individuals aged 20 or above.

1.2 Household balance sheet data

The most reliable source of information on household wealth is HBS data. As shown in Table 1-1, “complete” financial and non-financial balance sheet data are available for 29 markets for at least one year. These are predominantly high-income markets, the exceptions being China, Mexico and South Africa, which fall within the upper middle-income category according to the World Bank, and India which is classed as lower middle-income. The data are described as complete if financial assets, liabilities and non-financial assets are all adequately covered. Another 24 markets have financial balance sheets, but no details of real assets. This group contains seven upper middle-income markets, including Russia. It also includes ten other transition markets. Hence it is less biased toward the rich Western world than the group with complete household balance sheets. The sources of these data are recorded in Table 1-2.

Europe and North America, and OECD markets in particular, are well represented among markets with HBS data. China joined this group a few years ago. There had been considerable recent discussion of the household balance sheet in China. Li (2017) surveyed the series that had been developed by different researchers. Piketty et al. (2017, 2019) provide the most comprehensive data and also the longest times series, so we use their estimates here. Li (2017) shows that his own independent estimates, which are for 2004–14 only, are similar to those of Piketty et al. (2017) if farmland is omitted from the latter. This provides support for the accuracy of the Piketty et al. estimates, but also a reason to prefer them, in addition to the greater length of their time series, since farmland is a key household asset in rural China. Piketty et al. estimate the value of this land carefully, taking into account its increasingly private character over time.

Relatively few markets have HBS coverage in Africa, Asia-Pacific and Latin America. However, it is available for some of the larger economies in these regions (see Table 1-1). Complete HBS data is found in Chile and Mexico (although not in all years), while financial HBS is available in Brazil and Colombia. In the Asia-Pacific region (excluding China and India) seven high-income markets, including for example Australia, Japan and Korea, have complete HBS data while three sizeable upper middle-income markets have financial HBS. Africa has the least coverage – HBS data is found only in South Africa.

1.3 Household survey data

Information on assets and debts is collected in nationally representative surveys undertaken in an increasing number of markets (see Table 1-3 for our current list and sources.) For two markets this is the only data we have, and we use it to help estimate wealth levels, as explained in the next section, as well as distributions. Data on wealth obtained from household

surveys vary in quality, due to the sampling and non-sampling problems faced by all sample surveys. The high skewness of wealth distributions makes sampling error important. Non-sampling error is also a problem due to differential response rates – above some level wealthier households are less likely to participate – and under-reporting, especially of financial assets. Both of these problems make it difficult to obtain an accurate picture of the upper tail of the wealth distribution using survey evidence alone. To compensate, wealthier households are oversampled in an increasing number of surveys. This is best done using individual information, as in the US Survey of Consumer Finances, the Household Finance and Consumption (HFCS) surveys in Finland, France and Spain, and the Wealth and Assets Survey (WAS) in the United Kingdom (Vermeulen, 2018). Over-sampling at the upper end is not routinely adopted by the developing markets that include asset information in their household surveys, but the reported response rates tend to be higher than in developed markets and the sample sizes are very large in some cases, e.g., in India.

The US Survey of Consumer Finance is sufficiently well designed to capture most household wealth, but this is atypical. In particular, surveys usually yield lower totals for financial assets compared with HBS data. However, surveys generally do remarkably well for owner-occupied housing, which is the main component of non-financial assets (Davies and Shorrocks, 2000). Our methodology recognizes the general under-reporting of financial assets in surveys and attempts to correct this deficiency.

For markets which have both HBS and survey data, when estimating wealth levels we give priority to the HBS figures. The HBS estimates typically use a market’s wealth survey results as one input, but also take account of other sources of information and should therefore dominate wealth survey estimates in quality. However, this does not ensure that HBS data are error-free.

1.4 Estimating the level and composition of wealth for other markets

We use standard econometric techniques to establish the determinants of per capita wealth levels in the 53 markets with HBS or survey data in at least one year. The regression equations are then used to estimate wealth levels in the markets that have no direct data on wealth. Availability of data on the explanatory variables needed for the latter procedure limits the number of markets that can be included. However, we are able to estimate wealth values for 171 markets, which collectively cover 95% of the world’s population in 2022 either from direct data on wealth or by using this regression-based procedure. There is a trade-off here between coverage and reliability. Alternative sets of explanatory variables could achieve greater market coverage, but not without compromising the quality of the regression-based estimates.

Separate regressions are run for financial assets, non-financial assets and liabilities. As errors in the three equations are likely to be correlated, the seemingly unrelated regressions (SUR) technique due to Zellner (1962) is applied, but only to financial assets and liabilities, since there are fewer observations for non-financial assets. In particular, we include a dummy for cases

where the data source is a survey rather than HBS data. This turns out to be negative and highly significant in the financial assets regression, indicating that the average level of financial assets tends to be much lower when the data derive from sample surveys. We use this result to adjust upwards the value of financial assets in the wealth level estimates for Indonesia and Uruguay. We also include region-income dummies to capture any common fixed effects at the region-income level, and year dummies to control for shocks – like the global financial crisis – or time trends that affect the world as a whole.

The resulting estimates of net worth per adult and the three components are reported in Table 2-2 for the years 2000 to 2022. HBS data are used where available (see Table 1-1); adjusted survey means are used for Indonesia and Uruguay in specific years.

A growing number of markets are reporting wealth data with relatively little delay – around three months in the case of the United States, for example. For markets lacking HBS data we use information on changes in house price indexes, share prices, and GDP per adult to update the estimates of each of the wealth components.

1.5 Wealth distribution within markets

An analysis of the global pattern of wealth holdings by individuals requires information on the distribution of wealth within markets. Direct observations on wealth distribution across households or individuals are available for 39 markets. The number of survey years we have varies across markets. Summary details are reported in Table 1-5 using a common template, which gives the shares of the top 10%, 5%, and 1%, together with other distributional information in the form of cumulated shares of wealth (i.e., Lorenz curve ordinates).

The distributional data have certain fairly standard features. The unit of analysis is usually a household or family, but is in a few cases the (adult) individual. Household sample surveys are employed in almost all markets. The exceptions are the Nordic markets (Denmark, Finland, Norway and Sweden), which use data from tax and other registers covering the entire population. For all other markets, except the United States, the wealth shares of the top groups are expected to be understated because wealthy households are less likely to respond, and because the financial assets that are of greater importance to the wealthy – e.g., equities and bonds – are especially likely to be under-reported. And in those markets using register data there can be difficulties due to valuation problems, e.g., in connection with pension assets and life insurance. The United States has Distributional Financial Accounts (DFA) published quarterly that combine the triennial Survey of Consumer Finance (SCF) and Flow of Funds balance sheet data, as well as taking into account the wealth of the “Forbes 400”. The DFA provides shares of the top 1%, top 10% and bottom 50%. We interpolate other shares using the SCF survey nearest in date.

The summary details reported in Table 1-5 show a great deal of distributional information, but there are some empty cells. Estimates for the empty cells were generated by a revised version of the Shorrocks-Wan ungrouping program, which constructs a synthetic sample conforming exactly to any set of

Lorenz values (Shorrocks and Wan, 2009). Where markets have some wealth distribution data, Lorenz curves for missing years are estimated by interpolation or by projection forwards or backwards.

For most markets lacking direct wealth distribution data, the pattern of wealth distribution was constructed from information on income distribution, based on the view that wealth inequality is likely to be fairly highly correlated with income inequality across the markets with missing wealth data. Income distribution data was derived from the World Income Inequality Database, and the ungrouping program was used to generate all the Lorenz curve values required for the same template applied to wealth distribution.

For the 40 markets that have data on both wealth and income distribution, the Lorenz curves for wealth are everywhere lower than for income, indicating that wealth is more unequally distributed than income. We calculate the Gini coefficient values for both income and wealth and then estimate the missing Lorenz curves for wealth by scaling down the Lorenz curves for income by the median ratio of income to wealth Ginis.

To generate regional and global wealth patterns, each market lacking income distribution data was assigned the average (adult population weighted) wealth distribution pattern for the corresponding subregion. This again was done in preference to simply disregarding the markets concerned.

1.6 Assembling the global distribution of wealth

To construct the global distribution of wealth, the level of wealth for each market was combined with details of its wealth pattern. Specifically, the ungrouping program was applied to each market to generate a set of synthetic sample values and sample weights consistent with the (estimated or imputed) wealth distribution, with the sample weights representing approximately 10,000 adults in the bottom 90% of the distribution, 1,000 adults in the top decile, and 100 adults in the top percentile. The wealth sample values were then scaled up to match the mean wealth of the respective market and merged into a single world dataset comprising between 1.1 million and 1.5 million observations for each year. The complete global sample may be processed in a variety of ways, e.g., to obtain the minimum wealth and the wealth share of each percentile in the global distribution of wealth. The distribution within regions may also be calculated, along with the number of representatives of each market in any given global wealth percentile.

1.7 Adjusting the upper wealth tail

The survey data which yield most of our wealth distribution estimates tend to under-represent the wealthiest groups and to omit ultra-high net worth individuals. This deficiency does not affect our estimates of average wealth levels around the world, since these are determined by other methods. But it does imply that the shares of the top percentile and top decile are likely to err on the low side unless adjustments are made to the upper tail.

We would also not expect to generate accurate predictions of the number and value of holdings of high-net-worth individuals.

We tackle this problem by exploiting well-known statistical regularities in the top wealth tail and by making use of information on the wealth holdings of named individuals revealed in the rich list data reported by Forbes magazine. As described in more detail in Section 3, we used the number of billionaires reported by Forbes to fit a Pareto distribution to the upper tail of 56 markets and five regions. The revised top tail values in the synthetic sample were then replaced by the new estimates, and the resulting sample for each market was re-scaled to match the mean wealth value. This sequence was repeated until the process converged, typically after a few rounds. The overall global weighted sample still contains between 1.1 and 1.5 million observations, typically representing about 100, 1,000 or 10,000 adults. The adjusted sample can be used to produce improved estimates of the true wealth pattern within markets, regions, and the world. The minimum sample size of 100 allows reliable estimates of the number and value of wealth holdings up to USD 100 million at the regional and global level. Estimates above USD 100 million are obtained by projecting the Pareto distribution forward.

1.8 Concluding remarks

Great progress has been achieved in recent years in the study of global household wealth. Data on the level of wealth have improved in quality and are available for more markets. New household wealth surveys have begun in many markets. However, much remains to be done to improve the quality and frequency of wealth data, and to make the data available for a greater number of markets. In the meantime, we will continue to try to fill the gaps in the estimates of wealth level by market and to improve the estimates of wealth distribution within markets. In future, some revisions to our estimates are inevitable. Nevertheless, we are confident that the broad trends revealed in the Global Wealth Report for 2023 will remain substantially intact.

Table 1-1: Coverage of wealth levels data

Complete financial and non-financial data for at least one year					Financial data (only)

2. Household wealth levels, 2000–22

2.1 Introduction

As explained in the previous chapter, we aim to determine the level and distribution of household wealth across the world. The first stage in this process is to estimate the average level of household wealth and its core components for every market and every year since 2000.

Table 2-1 identifies 217 markets in 2022 and reports some core variables, including the classification by region and income class, GDP per adult and our assessment of the quality of wealth data.

The procedure outlined in Chapter 1 describes the three ways in which wealth levels data are assembled: direct estimates via national household balance sheets (HBS) or household surveys; regression estimates using likely correlated variables; and imputations based on the subregion average wealth/GDP ratio. In practice, the situation is slightly more complicated because some markets have direct observations for, say, financial wealth, but require non-financial wealth to be estimated. The timeliness of direct data is greatly improved nowadays. For our end-2022 estimates, we used Q4 2022 HBS data on financial wealth and debts for 35 markets and Q3 2022 values for 8 further markets (Croatia, Cyprus, Mexico, the Netherlands, Poland, Russia, Switzerland and Turkey). These markets account for more than two-thirds of global wealth. For most of the remaining markets we have been able to produce regression-based estimates up to 2019 which have then been updated using recent movements in share prices, house prices, credit availability, GDP and gross national income.

In Table 2-1, we do our best to summarize the quality of wealth data for each market on a five-point scale. A market gets five points, and a good rating if it has complete HBS data, and either wealth distribution data or a good basis for estimating the shape of the wealth distribution. A satisfactory rating and four points go to markets that would get a good rating except that their HBS data does not cover non-financial assets. These markets must have a full set of independent variables allowing regression-based estimates of non-financial assets. Markets lacking HBS data, but with a household wealth survey or other wealth distribution data (from estate tax or wealth tax sources) get a fair rating and three points. A poor rating (two points) goes to markets without HBS or wealth distribution data, but having a full set of independent variables allowing estimation of their wealth levels based on our cross-market regressions.

If some independent variables are missing but the regression-based estimates can still be made, the rating is very poor (one point).

In Table 2-1, there are 46 markets for which wealth data quality is not assessed. The vast majority of these are small markets, very often Caribbean or Pacific Island states. For these markets we do not estimate wealth levels directly, but instead assign a value based on the average wealth/GDP ratio for the subregion in which it is located. This is unlikely to be grossly inaccurate, so we use these values when calculating the regional and global wealth figures. But because we have less confidence in these estimates, the separate market data are not reported in later tables.

2.2 Household wealth levels 2000–22

Table 2-2 summarizes information on household wealth this century for 164 markets, seven regions (including China and India), and the world as a whole. The data refer to end-year values. Most of the column content is self-explanatory. The last column indicates the estimation method used for the wealth levels, grouped into five categories. Most figures up to 2019 are labeled as either (1) "Original data" indicating data from official household balance sheets, or (2) "Regression" referring to estimated values based on wealth regressions. Two additional labels are reported for recent years where needed. "Original update" and "Regression update" mean original data (respectively, regression estimates) updated using trends in share prices, house prices and household consumption per adult.

Wealth estimates for recent years are subject to future revision as statistical agencies release more data. Wealth estimates for earlier periods should be less prone to change. As a rough guide, we expect that our wealth estimates prior to 2018 are not likely to change much in the future. However, statistical agencies occasionally make significant revisions to their historical data series – reflecting altered definitions of categories, or improved valuations, for example. When this happens, we are obliged to respect the new figures, and this can have repercussions for the wealth estimates of other markets, given the methods we employ.

Wealth trends 2000–22

From the data reported for individual years, time series can be assembled for a number of important wealth variables. Table 2-3 provides examples for the world and for each region. They

show that wealth per adult has grown from USD 31,389 to USD 84,718 over the period 2000–22, an average growth rate of 4.6% per annum. Since 2008 the growth rate has been lower in US dollar terms for most markets, but this is largely due to appreciation of the USD.

Table 2-4 provides similar details regarding the relative importance over time of the three main subcomponents of household wealth: financial assets, non-financial assets (principally housing and land) and debts. At the turn of the century, financial assets accounted for 55.4% of gross household assets. This share fell until 2008, when it briefly fell below 50%. In the aftermath of the global financial crisis, non-financial assets showed little growth worldwide, in contrast to financial wealth, which grew robustly. As a consequence, the share of financial wealth recovered to 53.1% by 2015. Non-financial assets did relatively better after 2015, causing the share of financial assets to slip back to 51.9% by 2018. Financial assets took the lead again in 2019 and 2020, but dropped significantly in 2022 and now account for 51.1% of gross assets. Expressed as a proportion of gross household wealth, household debt rose from 13.4% of gross wealth in 2000 to 14.6% in 2008, and has since fallen back to 11.5%, below the level at the start of the century.

Finally, Table 2-5 extracts information on changes in household wealth during the calendar year 2022. A few markets recorded significant increases this year. Brazil – the biggest loser in 2021 – reversed the losses of the previous year with a gain of USD 1.1 trillion. Total wealth also rose by more than USD 600 billion in Iran, India, Mexico and Russia. But the noticeable feature of 2022 was the large reductions in wealth recorded by Australia, Canada and China, each of which lost more than USD 1 trillion. These were topped by the USD 2.5 trillion lost by Japan and the USD 5.9 trillion shed by the United States. In percentage terms, New Zealand, Sweden, and Egypt posted the biggest losses, in part due to currency devaluations against the US dollar.

Table 2-1: Market details

Market	Region	Income group	GDP per adult	Wealth per adult	Wealth per adult	Total wealth	Share of world wealth	Wealth data quality

3. Estimating the distribution of global wealth

3.1 Comparison with data from rich lists

Our method of estimating global personal wealth is essentially a bottom-up approach. It begins by establishing the average level of wealth in different markets onto which we graft the pattern of wealth holdings derived from household surveys and other sources. Although sample surveys do not formally exclude high-net-worth (HNW) individuals with net assets above USD 1 million, they tend to be under-represented and their wealth holdings are likely to be undervalued. The same is true to a greater extent of ultra-high-net-worth (UHNW) individuals with net assets above USD 50 million. In fact, the US Survey of Consumer Finances – which otherwise does an excellent job in the upper tail of wealth distribution – explicitly omits the 400 wealthiest families from its sampling frame. Evidence suggests that other markets capture an even smaller fraction of individuals in high-wealth categories. So further analysis and appropriate adjustments are required in order to construct plausible estimates of the number of wealthy individuals and the size of their holdings.

In order to proceed, we exploit the fact that the top tail of wealth distribution is usually well approximated by the Pareto distribution, which produces a straight-line graph when the logarithm of the number of persons above wealth level w is plotted against the logarithm of w . Our data yield a close fit to the Pareto distribution in the wealth range from USD 250,000 to USD 5 million. Above USD 5 million the relationship begins to break down, and the correspondence weakens further above USD 50 million, as expected given the limitations of the data sources. However, it still seems reasonable to use a fitted Pareto line to estimate the number of individuals in the highest echelons of the wealth distribution.

To determine the precise features of the top wealth tail, we rely heavily on data on wealthy individuals provided by Forbes and other sources. We make particular use of the number of billionaires reported by Forbes, since the data are available for many years and are broadly comparable across markets. Rich-list data have many limitations. Valuations of individual wealth holdings are dominated by financial assets, especially equity holdings in public companies traded in international markets. For practical reasons, less attention is given to non-financial assets apart from major real estate holdings and trophy assets, such as expensive yachts. Even less is known – and hence recorded – about personal debts. Some people cooperate enthusiastically with those compiling the lists; others jealously guard their privacy. There are also different country listings for nationals and residents, which is especially evident for India, for instance. The true legal ownership within families – as opposed to nominal ownership or control – adds further complications. Reassigning family holdings above USD 10 billion, say, to individual members might well result in several

billionaire holdings, so the number of billionaires would increase in this instance. In other cases, reas-signing the family wealth would reduce all the individual holdings below the billionaire threshold. For all these reasons, rich-list data should be treated with caution. At the same time, the broad patterns and trends are informative, and they provide the best available source of information at the apex of global wealth distribution.

3.2 Adjusting the wealth pattern in the top tail

To mitigate some of the problems associated with small numbers of billionaires, we disregard markets that have recorded small numbers of billionaires in the Forbes list over the years. About 50 markets survive the cut. A further refinement involves converting the number of Forbes billionaires – which we assume refers to billionaire families – into the corresponding number of high wealth adults.

A small modification is made to the way that the Pareto curve is presented. The logarithm of the fraction of adults above a given wealth level w is plotted on the vertical axis, while the horizontal axis denotes wealth w expressed as a multiple of mean wealth, again on a logarithmic scale. This reformulation of the Pareto curve retains the core characteristic: a Pareto distribution still generates a straight line, but the reformulation now has the advantage that the graph remains invariant if either the wealth sample weights or the wealth values are scaled up or down by the same factor, as might happen if the adult population rises or average wealth is growing. Any change in the reformulated graph for the unadjusted wealth sample, like that portrayed in Figure 1 based on United Kingdom data, must therefore indicate a change in the relative distribution of wealth, as represented by the Lorenz curve. In practice, the relative distribution of wealth tends to change slowly, so the graph is unlikely to change much from year to year, at least for wealth levels up to, say, ten times the mean.

A Forbes data point for a single year can be constructed by computing the number of billionaires expressed as a percentage of the adult population (y-axis) and the minimum wealth of these billionaires (typically USD 1 billion exactly) expressed as a multiple of mean wealth (x-axis). Over time mean wealth and the number of billionaires as a fraction of the population both tend to increase, so the Forbes data points (the green dots in Figure 1) typically move towards the left and upwards

For any given year, our top-tail adjustment involves grafting onto the unadjusted curve a straight-line segment which is consistent with the Forbes observation, as captured by the red line in Figure 1. The unadjusted wealth sample values are then replaced by the fitted values in the top tail. However, this causes the sample mean to change, usually upwards. So the

sample values must be scaled in order to restore consistency with the known and fixed value of mean wealth, and the procedure repeated until the process converges, which typically happens in a few rounds.

The greatest drawback with the Forbes data is the small sample size for many markets in many years. This impacts on the reliability of the top-tail adjustments and especially on the trends in inequality over time. To help mitigate this problem and increase confidence in the inequality trends, for any given country we combine the Forbes observations over years and try to smooth out the year-on-year variation. Specifically, we construct a reference top-tail adjusted curve (like an extended version of the red line in Figure 1) and determine the deviation of each Forbes data point from this reference line. These deviations would be small if inequality changes little over the whole period – mainly just the result of sampling variability. But the evidence suggests that changes over time are often significant and systematic. We attempt to identify the underlying factors by regressing the deviations against the share of financial assets in total wealth and a time trend, with a possible structural break in 2007.

Figure 2 displays the outcome of this exercise for China. The fitted values are reassuringly close to the observations, suggesting that the share of financial assets and time trends account for much of the change in inequality over time. Figure 2 also highlights the upward time trend in the deviations from the reference curve, indicating a strong shift towards increasing inequality in China over the course of this century. For any country, when the number of billionaires is zero or small, we use the estimated deviations as the basis for making the top-tail adjustment. But for markets and years with an adequate number of billionaires – which includes China for almost all years this century – we retain the value obtained directly from the Forbes data.

3.3 Features of the global wealth distribution

Application of the top-tail adjustment results in a synthetic sample containing around 1.5 million observations for recent years, with each observation representing approximately 10,000 adults at lower wealth levels and 100 adults at the top end. These samples are then processed to generate summary data on the wealth pattern within markets, regions and the world.

Table 3-1 reports figures for individual markets, and Table 3-2 provides more detail at the regional level. The results allow us to visualize the global wealth distribution in the form of a wealth pyramid which places adults in one of four wealth bands: under USD 10,000; between USD 10,000 and USD 100,000; between USD 100,000 and USD 1 million; and over USD 1 million. The base level of the pyramid contains 2.8 billion adults, or 53% of the global population, but accounts for only 1.1% of global wealth. In contrast, dollar millionaires comprise 1.1% of all adults, but collectively own 46% of all assets. For adults with wealth exceeding

USD 100,000 and USD 1 million, Table 3-3 provides further summary information for individual markets.

Combining the samples for all markets allows the features of the global distribution of wealth to be identified, including, for instance, the minimum wealth of each percentile (i.e., 1% group) worldwide and the share of total wealth owned by this group. To be among the wealthiest half of the world at end-2022, Table 3-4 shows that an adult needs only net assets of USD 8,654, once debts have been subtracted. However, a person needs at least USD 137,333 to belong to the top 10% of global wealth holders and USD 1,081,342 to be a member of the top 1%. Taken together, the bottom half of the global population own less than 1% of total wealth. In sharp contrast, the richest decile holds 81% of the world's wealth, and the top percentile alone account for 44.5% of global assets.

The decile breakdown by regions has a number of interesting features. China dominates the upper middle section of the global wealth distribution, accounting for 42% of members of deciles 7–9. In contrast, residents of India are heavily concentrated in the lower wealth strata, accounting for almost a quarter of people in the bottom half of the distribution.

Figure 1: Fitted Pareto distribution to wealth top tail

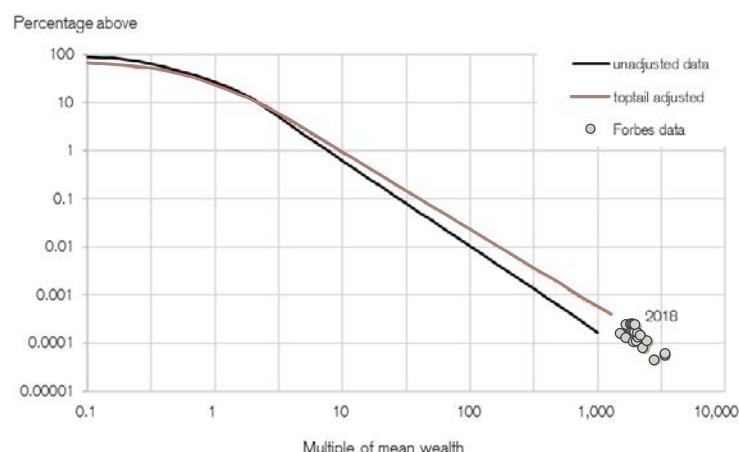

Figure 2: Deviation of Forbes data points from reference Pareto curve: China, 2000–17

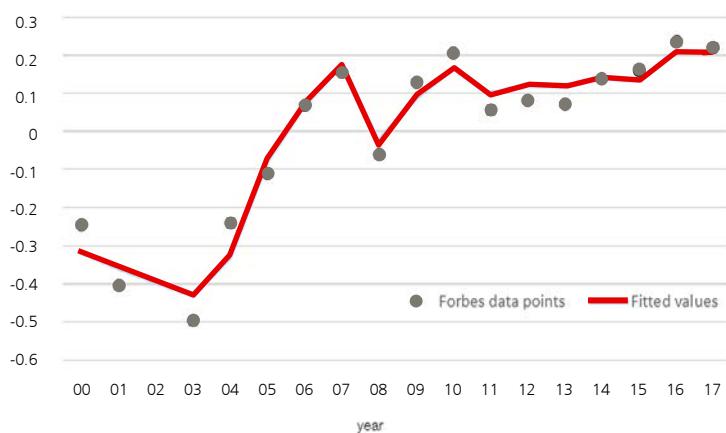

Table 3-4 shows that residents of Latin America are spread quite evenly across the global wealth spectrum. The Asia-Pacific region (excluding China and India) mimics the global pattern more closely still, although the apparent uniformity of the Asia-Pacific region masks a substantial degree of polarization between high-income markets, such as Hong Kong SAR, Japan and Singapore, and lower-income markets, such as Bangladesh, Indonesia, Pakistan and Vietnam. In fact, when high-income markets are excluded from the Asia-Pacific group, the wealth pattern within the remaining markets resembles that of India. Residents of Africa are even more heavily concentrated at the bottom end of the wealth spectrum: more than half of all African adults are found in the bottom two global wealth deciles. In sharp contrast, North America and Europe are heavily skewed toward the top tail, together accounting for 52% of adults in the top 10%, and 69% of those in the top percentile. Table 3-5 lists the markets that have gained or lost most members of the global top decile and percentile during 2022. It also reports changes in the number of millionaires during the past twelve months.

3.4 The number of high- and ultra-high-net-worth individuals

Apart from the rich lists, which cover a relatively small number of named individuals, there is little information on wealth holdings above USD 5-10 million. Survey details are patchy at best, and statistics based on tax returns are often inadequate given the complexity of wealth ownership arrangements. Our top-tail adjustments using rich-list data help to bridge this gap. Smoothing and extrapolating the wealth distribution at the top then produces plausible estimates of the global pattern of asset holdings in the high-net-worth (HNW) category from USD 1 million to USD 50 million, and in the ultra-high-net-worth (UHNW) range from USD 50 million upwards.

Table 3-6 reports the numbers for end-2022. While the base of the wealth pyramid is occupied by people from all markets at various stages of their lifecycles, HNW and UHNW individuals are heavily concentrated in particular regions and markets, and tend to share more similar lifestyles, participating in the same global markets for luxury goods, even when they reside in different continents. The wealth portfolios of these individuals are also likely to be more similar, with more of a focus on financial assets and, in particular, equity holdings in public companies traded in international markets.

For end-2022, we estimate that 59.1 million HNW adults have wealth between USD 1 million and USD 50 million, of whom the vast majority (51.5 million) fall within the USD 1–5 million range. North America accounts for the greatest number, significantly above Europe, which in turn hosts significantly more than Asia-Pacific markets excluding China and India. China now accounts for 10.5% of all HNW individuals, while Latin America, India and Africa together account for only 4.0% of the total. UHNW individuals with net assets above USD 50 million now number 243,062 worldwide by our calculations. Among individual markets, the United States leads with 51% of UHNW adults. China is a distant second with 14% of total UHNW membership.

Table 3-1: Wealth pattern within markets, 2022

Market	Adults	Mean wealth per adult	Median wealth per adult	Distribution of adults (%) by wealth range (USD)					Gini

4. Region and market focus

4.1 Introduction

Markets differ greatly in terms of their level and pattern of wealth holdings. There are also distinct differences at the regional level. It is therefore interesting to compare regional variations and trends since the year 2000, and to document the variety of market circumstances and experiences.

The accompanying tables collate information on wealth holdings for each of the regions and the top 50 Markets in terms of total household wealth. Some of the core data is summarized in Table 4-1. Table 4-2 reports wealth per adult measured in US dollars at current and “smoothed exchange rates”, the latter referring to 2021 annual average exchange rates adjusted for inflation differences between the United States and the market concerned. Table 4-3 provides similar information for aggregate household wealth measured in trillions of US dollars, and Table 4-4 shows the composition of wealth. Wealth shares of each decile and the top percentiles are recorded for each region and market in Table 4-5, along with the minimum wealth needed to belong to a given regional wealth quantile. Finally, Table 4-6 reports the Gini coefficient and the distribution of the adult population by wealth range.

4.2 Evolution of wealth distribution 2000–22

All regions have seen a rise in wealth per adult since the start of the century. When measuring wealth in local currencies, growth has been sustained apart from the financial crisis period in 2008–09 when all regions except Latin America suffered a setback. However, when we value wealth in current USD, the scenario changes somewhat. Between 2000 and 2007, regional growth rates benefited from the depreciation of the dollar, but recent years of dollar appreciation has had the opposite effect.

This shift in wealth dynamics has implications for global wealth inequality. Wealth levels in Europe and North America have always been far above those in other regions, particularly Africa and India. However, the regional imbalance narrowed during the early years of the century. Africa, India, and most notably China, all increased their share of world wealth between 2000 and 2007, hinting at the possibility that global wealth inequality was on a long-term downward trend. The shares of the top 1% and top 10% in world wealth fell significantly between 2000 and 2008. For instance, the top 1% share declined from 48.2% in 2000 to 42.6% in 2008. Since then, global wealth inequality has continued to drift slightly down, although the share of the top 1% rose somewhat between 2010–16 and has been stable around 44% in recent years.

4.3 Components of personal wealth

Table 4-4 displays the breakdown of wealth per adult for each region into financial and real (non-financial) forms, as well as the average level of debt. On average internationally, financial assets now comprise 51% of gross assets, while non-financial assets account for 49% and debts amount to 12%. Financial assets are relatively more important in North America, representing 66% of gross assets, while in Europe the share varies between 35% and 65%, with an average of 42%. In developing regions, non-financial assets typically account for the bulk of household wealth: they account for 57% of gross assets in Latin America and 79% of assets in India, for example.

Household debt appears to be systematically linked with the stage of economic development. The percentage share of debts in gross assets is 7% in Africa, 8% in India and 11% in China, but averages 12% in the Asia-Pacific region, Europe and North America.

4.4 Wealth distribution

Table 4-6 provides a breakdown of wealth distribution by region, revealing some notable differences. Nearly 90% of adults in Africa own less than USD 10,000, and 74% of adults in India fall in this range. Meanwhile the fraction is 30% in Europe, 19% in China and just 18% in North America. On the other hand, 32% of adults in Europe and 53% in North America have wealth above USD 100,000. The wealth distribution in both Latin America and the Asia-Pacific region resembles the pattern in the world as a whole, with Latin America showing 60% and Asia-Pacific 62% of all adults owning less than USD 10,000.

Among developed markets, there is wide variation in the percentage of adults falling into the lowest wealth brackets. Some markets report significant numbers of people in this category, while others have very few. This disparity is influenced by factors such as the availability of credit, including student loans, and the number of young adults living separately from their parents, which tends to make their low wealth more visible in the survey data.

Table 4-1: Summary details for regions and selected markets, 2022

About the authors

Professor Anthony Shorrocks is Director of Global Economic Perspectives Ltd and a Senior Research Fellow at the World Institute for Development Economics Research (UNU-WIDER) in Helsinki. After receiving his PhD from the London School of Economics (LSE), he taught at the LSE until 1983, when he became Professor of Economics at Essex University, serving also as Head of Department and Director of Economic Research for the British Household Panel Study. From 2001 to 2009, he was Director of UNU-WIDER in Helsinki. He has published widely on income and wealth distribution, inequality, poverty and mobility, and was elected a Fellow of the Econometric Society in 1996. Publications include "The age-wealth relationship: A cross section and cohort analysis" (Review of Economics and Statistics 1975) and "The portfolio composition of asset holdings in the United Kingdom" (Economic Journal 1982). Joint publications with James Davies include "Assessing the quantitative importance of inheritance in the distribution of wealth" (Oxford Economic Papers 1978), "The distribution of wealth" (Handbook of Income Distribution 2000), "The world distribution of household wealth" in "Personal Wealth from a Global Perspective" (Oxford University Press 2008), "The global pattern of household wealth" (Journal of International Development 2009), "The Level and Distribution of Global Household Wealth" (Economic Journal 2011), "Comparing Global Inequality of Income and Wealth," chapter 3 of Inequality in the Developing World (Oxford University Press, 2021) and "World Inequality" in the "Handbook of Labor, Human Resources and Population Economics" (Springer, Cham, 2022).

Professor James Davies has been a member of the Department of Economics at the University of Western Ontario in Canada since 1977 and served as chair of that department from 1992 to 2001. He received his PhD from the London School of Economics in 1979. James was the director of the Economic Policy Research Institute at UWO from 2001 to 2012. In 2010, he completed a five-year term as managing editor of Canadian Public Policy. He has authored two books and over 70 articles and chapters in books on topics ranging from tax policy to household saving and the distribution of wealth. He was editor of the volume, "Personal Wealth from a Global Perspective" (Oxford University Press 2008) and of "The Economics of the Distribution of Wealth," (Edward Elgar 2013). Other publications include "Long Run Canadian Wealth Inequality in International Context" (co-authored with Livio Di Matteo, Review of Income and Wealth, 2021) and "Economic inequality and COVID-19 death rates in the first wave: A cross-country analysis" (Covid Economics, March 2021).

Professor Rodrigo Lluberas is Professor of Economics at Universidad ORT Uruguay. Previously, he was Head of Financial Stability and Senior Economist at the Research Department of Uruguay Central Bank. He received his MSc in Economics from University College London and his PhD in Economics from Royal Holloway College, University of London. He has been a visiting scholar at the Institute for Fiscal Studies and an economist at Willis Towers Watson in London. He has been consultant for the Interamerican Development Bank and Corporación Andina de Fomento. His main areas of expertise are pensions, consumption, firms' expectations and wealth. His publications include "Estimating the Level and Distribution of Global Wealth, 2000–2014", Review of Income and Wealth, 2017, co-authored with James Davies and Anthony Shorrocks, and "Wealth in Latin America: Evidence from Chile, Colombia, Mexico and Uruguay", Review of Income and Wealth, 2023, co-authored with Néstor Gandelman.

Professor Daniel Waldenström is Professor of Economics at the Research Institute of Industrial Economics in Stockholm. He was previously Professor at Uppsala University, guest Professor at the Paris School of Economics and Assistant Professor at University of California at Los Angeles. Daniel has served as a member of the Swedish Minister of Finance's Council of Economic Advisors since 2020, including a special appointment as advisor for Corona Crisis Policies, and has acted as advisor to government agencies, and to the OECD and the European Commission. His research focuses on income and wealth distribution and taxation. Publications include "Long-run trends in the distribution of income and wealth" (Handbook of Income Distribution, 2015, with Jesper Roine), "Wealth inequality in Sweden: What can we learn from capitalized income tax data?" (Review of Income and Wealth, 2018, with Jacob Lundberg), "Global Earnings Inequality" (Economic Journal, 2020, with Olle Hammar) and "How should capital be taxed?" (Journal of Economic Surveys, 2020, with Spencer Bastani)."

Important information in the event this document is distributed by the following domestic businesses (which have separate local entities to that of the location that prepared the material)

Austria This publication is not intended to constitute a public offer under Austrian law. It is distributed only for information purposes by UBS Europe SE, Niederlassung Österreich, with place of business at Wächtergasse 1, A-1010 Wien. UBS Europe SE, Niederlassung Österreich is subject to the joint supervision of the European Central Bank ("ECB"), the German Central Bank (Deutsche Bundesbank), the German Federal Financial Services Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht), as well as of the Austrian Financial Market Authority (Finanzmarktaufsicht), to which this publication has not been submitted for approval. UBS Europe SE is a credit institution constituted under German law in the form of a Societas Europaea, duly authorized by the ECB.

Bahrain UBS is a Swiss bank not licensed, supervised or regulated in Bahrain by the Central Bank of Bahrain and does not undertake banking or investment business activities in Bahrain. Therefore, clients have no protection under local banking and investment services laws and regulations.

Brazil This publication is not intended to constitute a public offer under Brazilian law or a research analysis report as per the definition contained under the Comissão de Valores Mobiliários ("CVM") Instruction 598/2018. It is distributed only for information purposes by UBS Brasil Administradora de Valores Mobiliários Ltda. and/or of UBS Consenso Investimentos Ltda., entities regulated by CVM.

Canada In Canada, this publication is distributed by UBS Investment Management Canada Inc. (UBS Wealth Management Canada).

UBS Wealth Management is a registered trademark of UBS AG. UBS Bank (Canada) is a subsidiary of UBS AG. Investment advisory and portfolio management services are provided through UBS Investment Management Canada Inc., a whollyowned subsidiary of UBS Bank (Canada). UBS Investment Management Canada Inc. is a registered portfolio manager and exempt market dealer in all the provinces with the exception of P.E.I. and the territories.

All information and opinions as well as any figures indicated are subject to change without notice. At any time UBS AG ("UBS") and other companies in the UBS group (or employees thereof) may have a long or short position, or deal as principal or agent, in relevant securities or provide advisory or other services to the issuer of relevant securities or to a company connected with an issuer. Some investments may not be readily realisable since the market in the securities is illiquid and therefore valuing the investment and identifying the risk to which you are exposed may be difficult to quantify. Past performance of investments is not a guarantee of future results and the value of investments may fluctuate over time.

For clients and prospective clients of UBS Bank (Canada) and UBS Investment Management Canada Inc., please note that this document has no regard to the specific investment objectives, financial situation or particular needs of any

recipient. Neither UBS Bank (Canada) nor UBS Investment Management Canada Inc. is acting as an adviser or fiduciary to or for any participant in this event unless otherwise agreed in writing. Not all products or services may be available at UBS Bank (Canada). Some products and services may be legally restricted for residents of certain countries. For more information on our products and services, visit https://www.ubs.com/ca/en/wealth_management/planning_life.html.

UBS does not provide tax or legal advice and you should consult your own independent advisers for specific advice based on your specific circumstances before entering into or refraining from entering into any investment.

You agree that you have provided your express consent to receive commercial electronic messages from UBS Bank (Canada), and any other UBS entity within the UBS global group of companies, with respect to this and other similar UBS events and to receipt of information on UBS products and services. You acknowledge and understand that this consent to electronic correspondence may be withdrawn by you at any time. For further information regarding how you may unsubscribe your consent, please contact your UBS Advisor or UBS Bank (Canada) directly at 1-800-268-9709 or https://www.ubs.com/ca/en/wealth_management/your_relationship/how_to_get/wealth_management.html.

This document may not be reproduced or copies circulated without prior written authorization of UBS.

Czech Republic UBS is not a licensed bank in the Czech Republic and thus is not allowed to provide regulated banking or investment services in the Czech Republic. Please notify UBS if you do not wish to receive any further correspondence.

Indonesia, Malaysia, Philippines, Thailand This material was provided to you as a result of a request received by UBS from you and/or persons entitled to make the request on your behalf. Should you have received the material erroneously, UBS asks that you kindly destroy/delete it and inform UBS immediately. The material may not have been reviewed, approved, disapproved or endorsed by any financial or regulatory authority in your jurisdiction. You are advised to seek independent professional advice in case of doubt.

Israel UBS is a premier global financial firm offering wealth management, asset management and investment banking services from its headquarters in Switzerland and its operations in over 50 countries worldwide to individual, corporate and institutional investors. In Israel, UBS Switzerland AG is registered as Foreign Dealer in cooperation with UBS Wealth Management Israel Ltd., a wholly owned UBS subsidiary. UBS Wealth Management Israel Ltd. is a Portfolio Manager licensee which engages also in Investment Marketing and is regulated by the Israel Securities Authority. This publication is intended for information only and is not intended as an offer to buy or solicitation of an offer. Furthermore, this publication is not intended as an investment advice and/or investment marketing and is not replacing any investment advice and/or investment marketing provided by the relevant licensee which is adjusted to each person needs. The word "advice" and/or any of its derivatives shall be read

and construed in conjunction with the definition of the term "investment marketing" as defined under the Israeli Regulation of Investment Advice, Investment Marketing and Portfolio Management Law, 1995.

Italy This publication is not intended to constitute a public offer under Italian law. It is distributed only for information purposes by UBS Europe SE, Succursale Italia, with place of business at Via del Vecchio Politecnico, 3-20121 Milano. UBS Europe SE, Succursale Italia is subject to the joint supervision of the European Central Bank ("ECB"), the German Central Bank (Deutsche Bundesbank), the German Federal Financial Services Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht), as well as of the Bank of Italy (Banca d'Italia) and the Italian Financial Markets Supervisory Authority (CONSOB – Commissione Nazionale per le Società e la Borsa), to which this publication has not been submitted for approval. UBS Europe SE is a credit institution constituted under German law in the form of a Societas Europaea, duly authorized by the ECB.

Luxembourg This publication is not intended to constitute a public offer under Luxembourg law. It is distributed only for information purposes by UBS Europe SE, Luxembourg Branch ("UBS"), R.C.S. Luxembourg n° B209123, with registered office at 33A, Avenue J. F. Kennedy, L-1855 Luxembourg. UBS is a branch of UBS Europe SE, a credit institution constituted under German law in the form of a Societas Europaea (HRB n° 107046), with registered office at Bockenheimer Landstrasse 2–4, D-60306 Frankfurt am Main, Germany, duly authorized by the German Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – "BaFin") and subject to the joint prudential supervision of BaFin, the central bank of Germany (Deutsche Bundesbank) and the European Central Bank. UBS is furthermore supervised by the Luxembourg prudential supervisory authority (Commission de Surveillance du Secteur Financier), in its role as host member state authority. This publication has not been submitted for approval to any public supervisory authority.

Mexico UBS Asesores México, S.A. de C.V ("UBS Asesores") an affiliate of UBS Switzerland AG, incorporated as a non-independent investment advisor under the Securities Market Law, due to the relation with a Foreign Bank. UBS A sesores was incorporated under the Securities Market Law. UBS Asesores is a regulated entity and it is subject to the supervision of the Mexican Banking and Securities Commission (Comisión Nacional Bancaria y de Valores, "CNBV") which exclusively regulates UBS A sesores regarding the rendering of portfolio management services when investment decisions are taken on behalf of the client, as well as on securities investment advisory services, analysis and issuance of individual investment recommendations, so that the CNBV has no surveillance facilities nor may have over any other service provided by UBS Asesores. UBS Asesores is registered before the CNBV under Registry number 30060. Such registry will not assure the accuracy or veracity of the information provided to its clients. UBS Asesores is not part of any Mexican financial group, is not a bank and does not receive deposits or hold securities. UBS A sesores does not offer guaranteed returns. UBS Asesores

has revealed any conflict of interest that could have before. UBS Asesores does advertise any banking services and can only charge the commissions expressly agreed with their clients for the investment services actually rendered. UBS Asesores receive commissions from issuers or local or foreign financial intermediaries that provide services to its clients. You are being provided with this UBS publication or material because you have indicated to UBS Asesores that you are a Sophisticated Qualified Investor located in Mexico.

Monaco This document is not intended to constitute a public offering or a comparable solicitation under the Principality of Monaco laws, but might be made available for information purposes to clients of UBS (Monaco) SA, a regulated bank which has registered office 2 avenue de Grande Bretagne 98000 Monaco under the supervision of the "Autorité de Contrôle Prudentiel et de Résolution" (ACPR) for banking activities and under the supervision of "Commission de Contrôle des Activités Financières" for financial activities". The latter has not approved this publication.

Nigeria UBS Switzerland AG and its affiliates (UBS) are not licensed, supervised or regulated in Nigeria by the Central Bank of Nigeria or the Nigerian Securities and Exchange Commission and do not undertake banking or investment business activities in Nigeria.

Poland UBS is a premier global financial services firm offering wealth management services to individual, corporate and institutional investors. UBS is established in Switzerland and operates under Swiss law and in over 50 countries and from all major financial centres.
